

Condition Monitoring Surveys

The best way to avoid machinery failures is to know they're coming. This is precisely what condition monitoring enables. It is the process of determining the condition of machinery while in operation. The three major steps in a condition monitoring system are

Data acquisition-

Collect machine health data with diagnostic equipment

Data processing- Identify what machine problems exist

Data assessment- Prioritise work in order of criticality

Successfully implementing a condition monitoring programme enables the repair of problem components prior to failure. This not only helps reduce the possibility of catastrophic failure, but also allows you to order parts in advance, schedule manpower, and plan other repairs during the downtime.
